PROFILE

Passionate about the UNIX ecosystem and the open-source world since my teenage years, I regularly contribute to community projects. I value knowledge sharing and rigorous technical documentation.

EDUCATION

Epitech, Montpellier, Paris, France *September 2020–October 2025*

- *Expert Degree in Information Technology*

Technological University Dublin, Dublin, Ireland *October 2023–August 2024*

- *Degree in Data Science*

PROFESSIONAL EXPERIENCE

DevOps & Cloud Engineer Intern, [Thales AVS](#), Mérignac, France *March 2025–August 2025*

- Deployment of GitLab Workspaces in a Kubernetes cluster managed by Azure (AKS).
- Creation of Python projects that automate security verification of IT projects in the software forge and help them comply with company best practices. These projects are launched from GitLab CI/CD pipelines and produce detailed security reports with scores and intuitive graphics.
- Development of a syntax analysis algorithm to process data produced by functional test execution and optimizations through multi-threading.
- Use of AI programming agents, including CodeCompanion, to analyze and secure the source code of test execution software.

Site Reliability Engineer Intern, [VINCI Autoroutes](#), Vedène, France *September 2024–March 2025*

- Creation of Azure resources followed by deployment of Backstage.io with AKS.
- Integration of existing users and groups in Microsoft Entra ID, implementation of authentication with Azure, securing access with an Application Gateway followed by Azure Firewall, then integration of software factory services into Backstage.io.
- Creation of a Python project that produces a CLI to simplify the addition of existing projects in Backstage.io.

Site Reliability Engineer Intern, [VINCI Autoroutes](#), Vedène, France *April 2023–July 2023*

- Automated deployment of resources in Azure, NeuVector (AKS) and its configuration with Terraform. Monitoring was set up with Grafana's Prometheus, and the entire solution implementation was fully documented.
- Contributions to NeuVector's public source code and to NeuVector's Prometheus exporter.
- Creation of a [library](#) in Go to interact with the NeuVector Controller as well as a [Terraform provider](#) in Go that manages the lifecycle of NeuVector objects.

NOTABLE PERSONAL PROJECTS

Digital presence *September 2022–Present*

- [Website](#) where I share things I find interesting.
- Maintenance for over a year of an organized online [knowledge base](#) that provides all my notes.

Infrastructure and Services *September 2022–September 2026*

- Provision of free services open to everyone. All services are containerized using Docker and accessible behind NGINX, with deployment automated using an Ansible playbook and DNS records managed through a Terraform project. Prometheus and Grafana are used to monitor the health of the services and system, and automatic backups are performed weekly. Authentication to the services is managed by an OpenLDAP server, with blocking mechanisms in place to prevent malicious authentication attempts. All technical documentation and user statistics are publicly available. The infrastructure was decommissioned in September 2026, while all associated configurations and automation remain publicly available in the dedicated [GitHub organization](#).
- Transformation of an old machine into a [personal homelab](#), with the goal of giving unused computer hardware a second life. It has thus become a private platform where all identities and access are managed by Authentik, and all services are exposed through Traefik. It includes automatic backups, Grafana and Uptime Kuma alerts, as well as a collection of services for managing media and files. Most of the technical details are documented on [this webpage](#).

Application Packaging

March 2024–Present

- Regular [contributions](#) to the official Nix(OS) expression collection (over a hundred in 2025) and service [modularization](#).
- [Porting](#) of X11-compatible applications and games for OpenBSD.
- [Portages](#) of Plan 9 programs for UNIX.

Algorithms and Data Structures

December 2023–Present

- Strong theoretical and practical foundations in algorithms and data structures.
- [Solving](#) algorithmic problems on various dedicated platforms and completing the [Advent Of Code](#).

Gopher Protocol

June 2026–July 2026

- Development of a [framework](#) in Go for building highly customized Gopher applications compatible with the RFC 1436 standard and beyond. It comes with a CLI that implements a standard application using the framework, as well as a NixOS module for deploying it as a service.
- Development of a [Go extension](#) for the aforementioned framework, adding support for creating user-facing forms.
- Development of a [Gopher application](#) in Go using the two aforementioned projects. It provides a persistent Gopher webring, allowing users to add, remove, and validate Gopher sites wishing to join the chain. It also allows retrieving the neighboring nodes of a given node and selecting a node at random.

Packet Filtering with Linux

January 2024–November 2024

- Development of an [XDP project](#) in C to filter packets in kernel space. The goal is to have a high-performance packet filter loaded in kernel space, with the ability to manage custom filtering rules for different network layers from user space.

Lox Interpreters

March 2024–November 2024

- Implementation of interpreters for the Lox language from scratch with different parsing and code evaluation methods, including a [Tree-Walk interpreter](#) in Python and a [bytecode virtual machine](#) in C.

LANGUAGES

French, native language
